Research Area- Cognitive IoT:

When demands are high and resources are yet to be investigated, it is wise to inspire development through the merger of technologies and eventually lead to exclusive structures. Today, IoT or Internet of Things has also progressed to deliver as cognitive IoT. Cognitive IoT is the method of integrating cognitive computing technologies on the data generated by smart devices. In Cognitive computing, a device is configured to simulate human cognition. It uses machine learning algorithms to transform smart devices. IoT devices will respond to environmental changes without human involvement. The local and networked sensors will foresee exterior world through several expert knowledge sharing and data. That will be associated with processing, understanding and making sense of the world.

Objectives:

Goal of this research is

- To analyse the IoT applications.
- To study available machine learning algorithms in Cognitive IoT applications.
- To find new possibilities in Cognitive IoT and its applications to the public.
